1. Adding collaborator to your GIT Repository. Click on "Settings" and on "Collaborators"

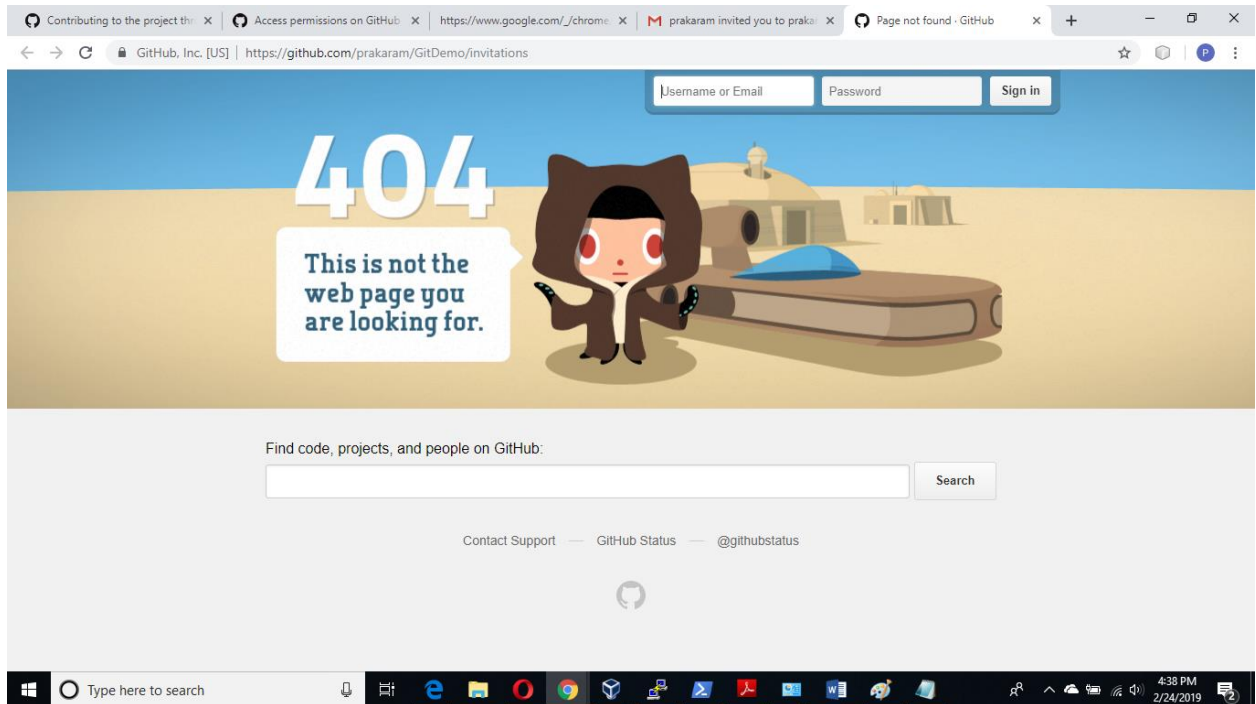

2. Search collaborator by their account name and click on "Add Collaborator"

3. Your collaborator would have received a mail, depending on the mail id associated with their account. They may click on "View invitation". Alternately a link is provided (as specified in the second screenshot) which may be copy pasted to browser.
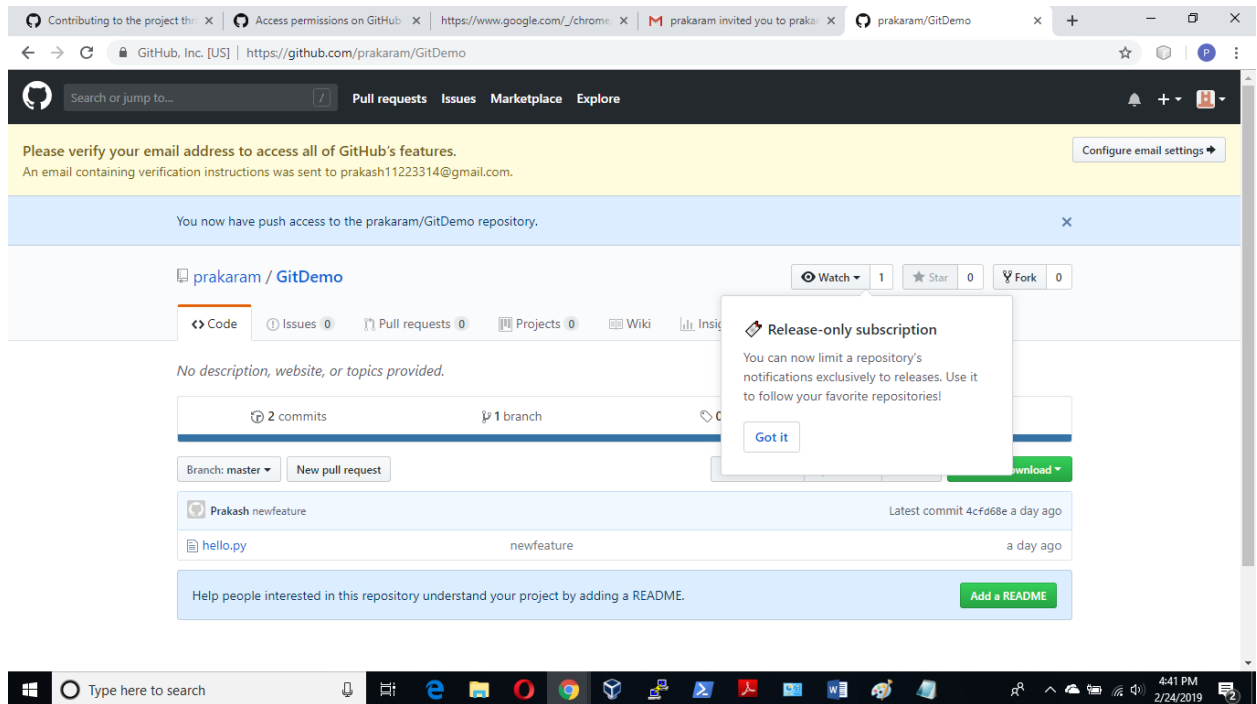

4. Note that collaborator should have already signed into their GitHub account. Otherwise they will get following response on the browser. This require them to login with their GitHub credentials.

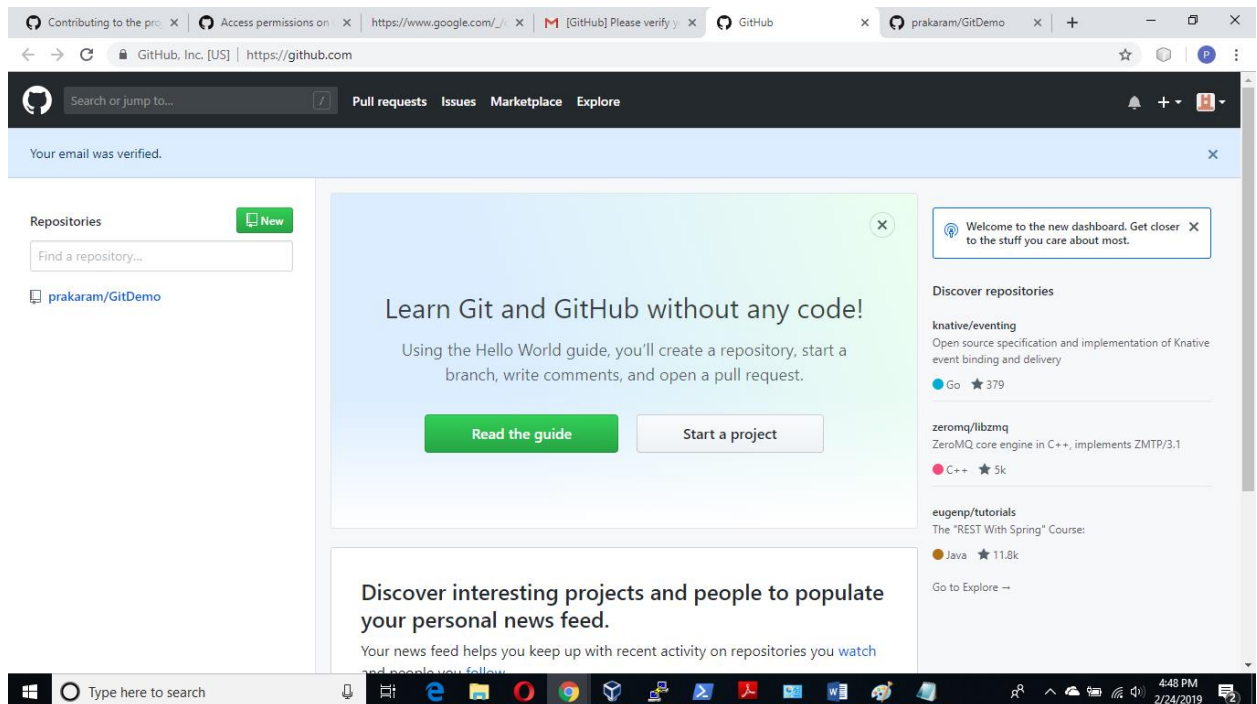

5. Require collaborator to login with their GitHub credentials. Accept the invitation if you wish to be collaborator.
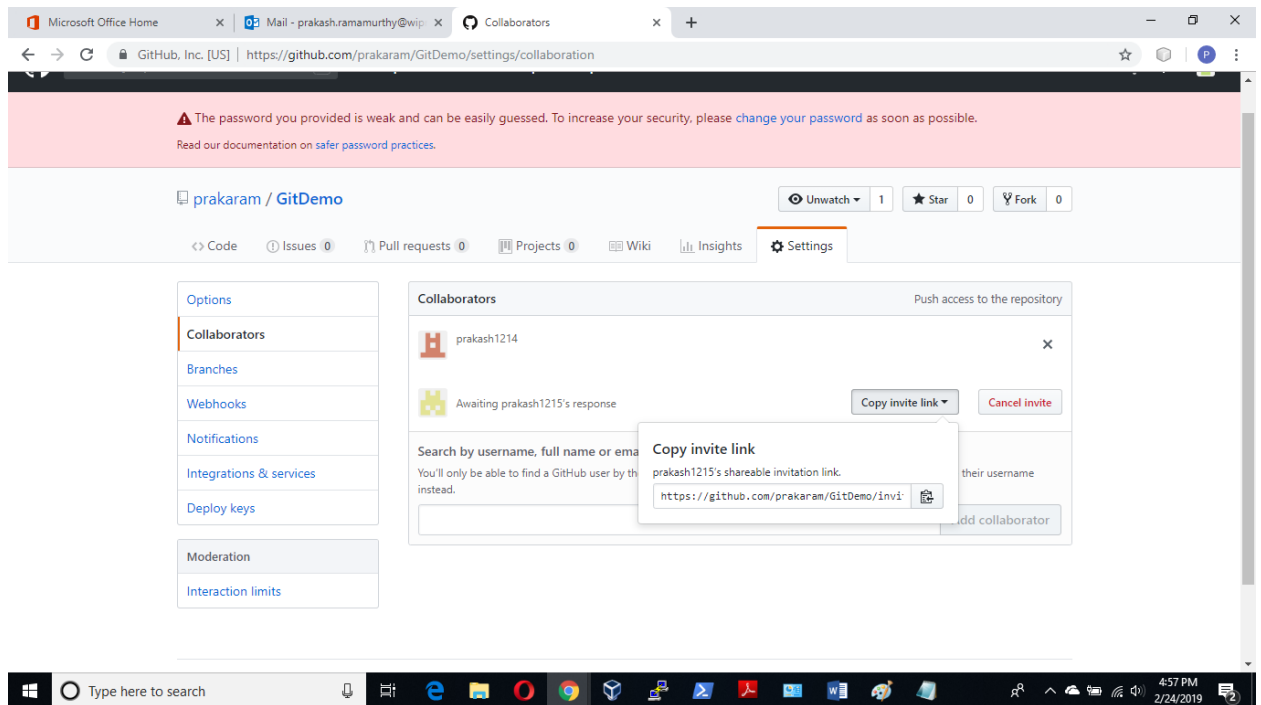

6. You get access to your co-developer's repository.

7. Home Page of collaborator would be having the project listed.

8. Watch the list of collaborators in the Settings >> Collaborators page of repository owner. Here I am trying to add another collaborator. This had already triggered the mail. But if the collaborator had not received the mail due to any reason, you may copy the link (Copy invite link) and share the same with collaborator in a separate mail.

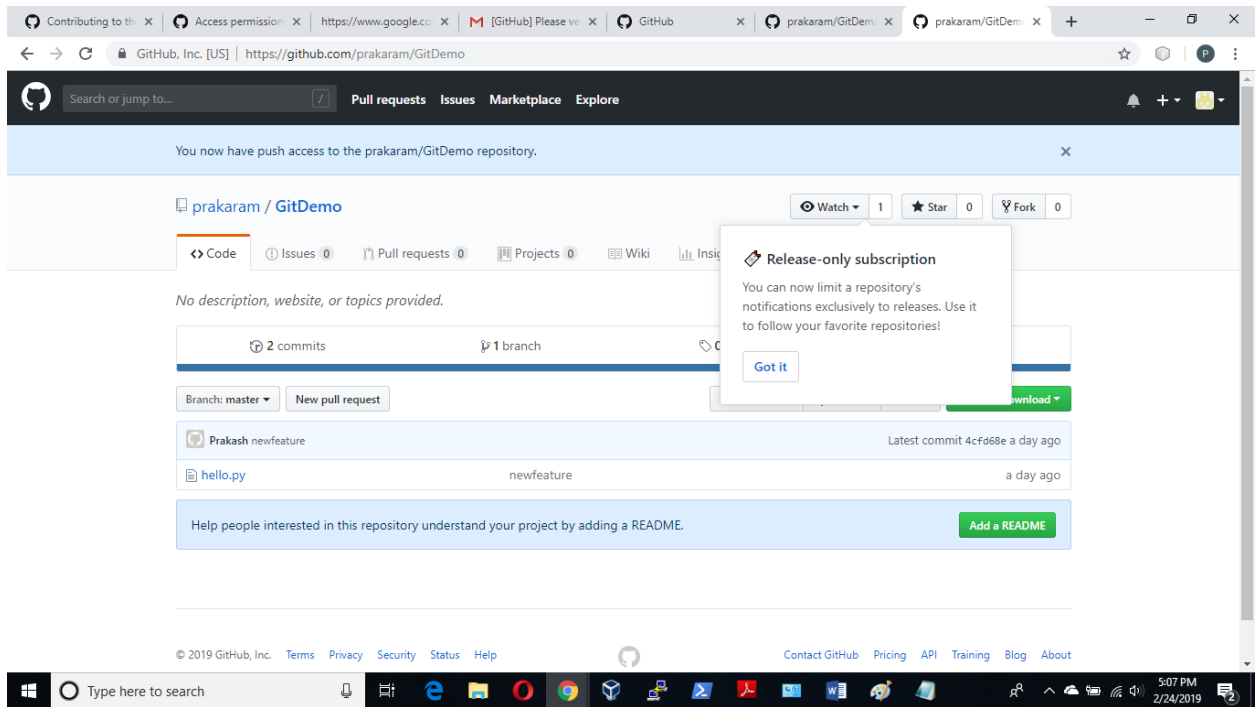

9. Following is home page of our new collaborator prakash1215, where they are yet to accept the invitation. In a different tab they may now paste the "invite link" provided by you. Alternately as we did before they may also check their mail box for mail if received.
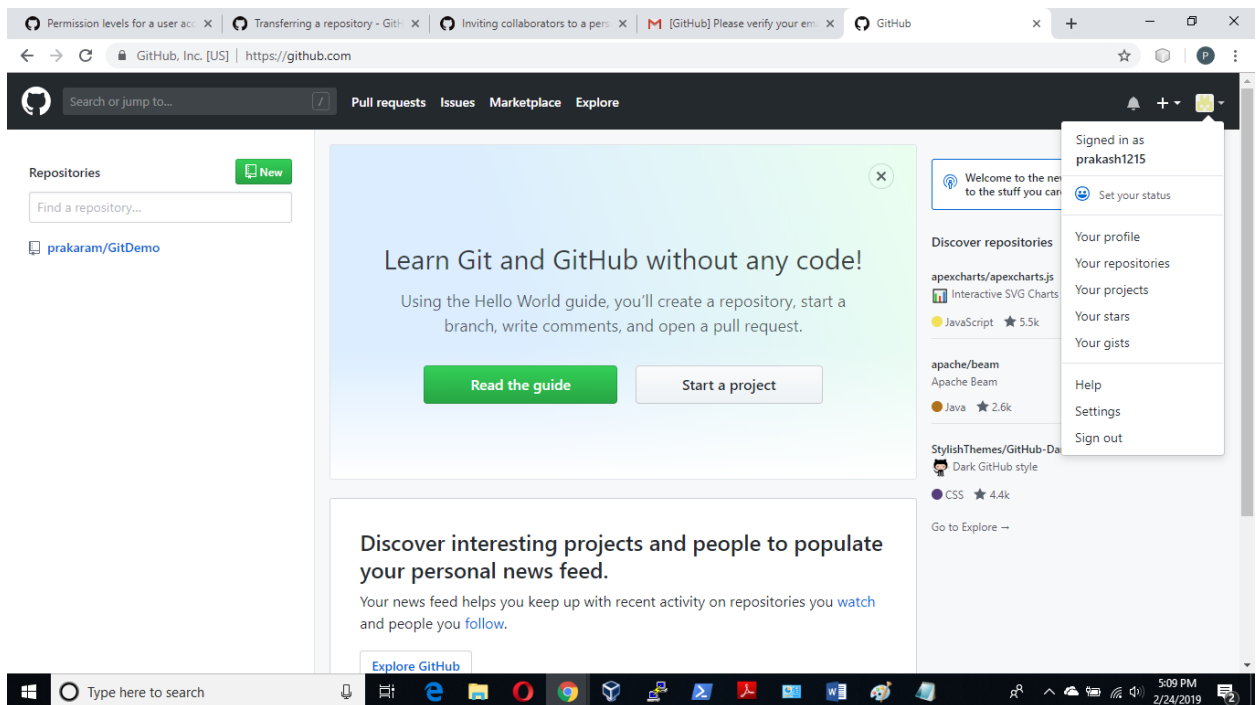

10. This would take them to the page to "Accept Invitation".

11. On accepting they will get access to repository.

12. Their home page will now reflect this project.

13. Note only repository owner can invite collaborators. Settings >> Collaborators link reflect the list of collaborators. Repository owner can remove "x" any collaborator at any time.

14. Repository owner may enforce a "Temporary Interaction limits" on these users.
